

A B S T R A C T

A folding table tennis table comprising a support,
two table tops that are movable relative to the support
5 between a horizontal position and a vertical position,
each table top co-operating with the support to form a
structure of configuration that is reversibly deformable
between an unfolded state corresponding to the horizontal
position of the table top and a folded state
10 corresponding to the vertical position of the table top,
which structure includes retractable locking means to
lock it in at least one of said two states. According to
a characteristic of the invention, the deformable
structure includes abutment means that engage when its
15 configuration comes close to a configuration
corresponding to a locked state, thereby opposing
reversibility in said configuration.
